#### PLAN. INNOVATE. ENGAGE.

### Parallel session 1 - WG1

### Sector coupling concepts and framework WG1 white paper in progress

#### ANTONIO ILICETO WG1 chair

ETIP SNET – Regional Workshop Petten 19-20 September 2019

- > Among other activities, WG1 is elaborating some White Papers, on:
  - ♦ Holisitic architectures  $\rightarrow$  published March 2019
  - ✤ TSO-DSO coordination in grid planning  $\rightarrow$  expected early 2020
  - Sector Coupling  $\rightarrow$  expected by end 2019
- > White Paper intended half way between Tutorial and Position Paper
- > Technologies/processes covered with technical details:
  - Role of storage for sector coupling
  - Power to heating & cooling
  - Power to mobility
  - Power to Gas/Fuels

Leader: Marie Munster , Danish Technical University

### Beyond present concept of 'residual load profile'

### Beyond present concept of 'residual load profile'

• Evolution of electric system operating philosophy:

**THE PAST**  $\rightarrow$  Load profile given as independent variable, generation has to follow the load

THE PRESENT → Residual load profile (total load minus variable RES generation) covered by flexible generation + pioneering flexibility means

**THE FUTURE**  $\rightarrow$  Dominance of <u>inflexible generation</u> but also of <u>flexible loads</u> plus a wide portfolio of <u>flexibility means</u>

**Load follows Generation** 

# Independent variables to be optimised grow exponentially

- Under the overarching objective of facilitating defossilisation/decarbonisation also of other sectors with renewable electricity, the main goal of power system management shall become:
  - Operation: how to best <u>use</u> and <u>combine</u> the many flexibility means available to optimise RES generation having quasi-zero variable cost
  - Planning: optimise development of the grid in coordinated manner with development of many other indipendent actors and sectors: not only generation and load, but also new services and new interfaces

# Independent variables to be optimised grow exponentially

- Main goal of power system management shall become:
  - Operation: how to best <u>use</u> and <u>combine</u> the many flexibility means available to optimise RES generation having quasi-zero variable cost
  - Planning: optimise development of the grid in coordinated manner with development of many other indipendent actors and sectors: not only generation and load, but also new services and new interfaces

## Conceptual components of Sector Coupling

- Energy conversion process towards an adjacent industrial sector, where energy can follow different paths:
- stored more easily than within the electric system, for successive re-conversion to electricity: shift in time and in some cases also in space
- consumed, if it is cheaper/cleaner than other energy sources typical of that sector, either temporarily (operational optimisation) or permanently (electrification, which increases the amount of coupling potentials)
- transported, in some cases where transport performances can be higher than transmitting electricity

> Many combinations of the above options  $\rightarrow$  sector coupling is a complex multi-variables optimisation problem, with the objective of minimal cost, with given decarbonisation targets & boundary conditions

## Conceptual components of Sector Coupling

- Energy conversion process towards an adjacent industrial sector, where energy can follow different paths:
- stored more easily than within the electric system, for successive re-conversion to electricity: shift in time and in some cases also in space
- consumed, if it cheaper/cleaner than other energy sources typical of that sector, either temporarily (operational optimisation) or permanently (electrification, which increases amount of coupling potentials)
- transported, in some cases where transport performances can be higher than transmitting electricity
- ➢ Many combinations of the above options → sector coupling is a complex multi-variables optimisation problem, with the objective of minimal cost, with given decarbonisation targets & boundary conditions

## **ETIP SNET OF ELECTRICITY CONVERSION PROCESSES - 1**

Rationale = End Use YES	TRADITIONAL LOADS - mono- directional conversion - inflexible load profile - Includes CHP when driven only by local heat+power profile	FLEXIBLE LOADS - providing supply/demand balance - providing ancillary services - providing peak shaving - require market mechanisms/price signals to be deployed Demand response, inter customers, smart EV char & adjustable industrial p	ging, CHP	
NO	UNDESIRED EFFECTS - power losses - vRES curtailment		<ul> <li>bidirectional constructional construction</li> <li>devices and prossystem → controc</li> <li>Providing relief to space&amp;time</li> <li>Pump hy CAES/LAES</li> </ul>	RE STORAGE nversion cess within electric olled by electric operators to local congestions in dro, flywheels, , supercapacitors, hary batteries

## **Conclusions and White Paper aim**

- > Important Topic to investigate , being at center of energy system integration
- > Mapping main technologies, their TRL, potentials and barriers
- > Deployment prospects and impact of the most promising solutions
- Needs for future R&I activities and especially of demo/pilot projects at limited footprint but full scale
- Involvement of other sectors' operators and decision makers (market actors, regulators, local utilities, specific industries
